10 TITLE OF THE INVENTION
FIBRINOGEN RECEPTOR ANTAGONISTS

CROSS-REFERENCES

15 This application is a continuation-in-part
of U.S. Serial No. 720,357, filed June 25, 1991,
which is a continuation-in-part of U.S. Serial No.
696,893, filed May 7, 1991.

20 FIELD OF THE INVENTION

This invention relates to the discovery of
fibrinogen receptor antagonists of Formula I for use
in inhibiting the binding of fibrinogen to blood
platelets and inhibiting the aggregation of blood
platelets when administered to mammals, preferably
25 humans.

BACKGROUND OF THE INVENTION

The interaction of platelets with the
coagulation and fibrinolytic systems in the
30 maintenance of hemostasis may become pathogenic,

- 2 -

requiring prevention and treatment. The fibrinogen receptor antagonists of Formula I are useful in treating various diseases related to platelet aggregation and fibrin formation.

5 An interest in platelet inhibitors has reemerged as a result of a better understanding of the role of platelets and thrombosis in the pathogenesis of vascular disease, including unstable angina, acute myocardial infarction and stroke.

10 Platelets are cell-like anucleated fragments, found in the blood of all mammals, which participate in blood coagulation. Fibrinogen is a glycoprotein present as a normal component of blood plasma. Fibrinogen participates in platelet
15 aggregation and fibrin formation in the blood clotting mechanism. Platelets are deposited at sites of vascular injury where multiple physiological agonists act to initiate platelet aggregation culminating in the formation of a platelet plug to minimize blood
20 loss. If the platelet plug occurs in the lumen of a blood vessel, normal blood flow is impaired.

 Platelet membrane receptors are essential in the process of platelet adhesion and aggregation. Interaction of fibrinogen with a receptor on the
25 platelet membrane complex IIb/IIIa is known to be essential for normal platelet function.

 Zimmerman et al., U.S. Patent No. 4,683,291, describes peptides having utility in the study of
30 fibrinogen-platelet, platelet-platelet, and cell-cell interactions. The peptides are described as having utility where it is desirable to retard or prevent formation of a thrombus or clot in the blood.

- 3 -

Pierschbacher et al., U.S. Patent No. 4,589,881, describes the sequence of an 11.5 kDal polypeptide fragment of fibronectin which embodies the cell-attachment-promoting activity of fibronectin.

5 Ruoslahti et al., U.S. Patent No. 4,614,517, describes tetrapeptides which alter cell-attachment activity of cells to various substrates. Figure 1 lists the polypeptides that were synthesized by Ruoslahti et al. in "determining the smallest peptide
10 exhibiting cell attachment activity." Ruoslahti et al., U.S. Patent No. 4,578,079, describes similar tetrapeptides.

Pierschbacher et al., Proc. Natl. Acad. Sci. USA, Vol. 81, pp.5985-5988, October, 1984, describe
15 variants of the cell recognition site of fibronectin that retain attachment-promoting activity. Pierschbacher et. al. further assayed the cell attachment-promoting activities of a number of structures closely resembling the Arg-Gly-Asp-Ser
20 peptide, and found "that the arginine, glycine, and aspartate residues cannot be replaced even with closely related amino acids, but that several amino acids can replace serine without loss of activity."

Ruoslahti et al., Science, Vol. 238, pp. 491-497, October 23, 1987, discuss cell adhesion
25 proteins. They specifically state that "elucidation of the amino acid sequence of the cell-attachment domain in fibronectin and its duplication with synthetic peptides establish the sequence Arg-Gly-Asp
30 (RGD) as the essential structure recognized by cells in fibronectin."

Cheresh, Proc. Natl. Acad. Sci. USA, Vol. 84,
pp. 6471-6475, September 1987, describes the
Arg-Gly-Asp-directed adhesion receptor involved in
attachment to fibrinogen and the von Willebrand
Factor.

Adams et al., U. S. Patent No. 4,857,508,
describes tetrapeptides which inhibit platelet
aggregation and the formation of a thrombus.

It is, therefore, an object of the present
invention to provide fibrinogen receptor antagonists
for use in inhibiting the binding of fibrinogen to
blood platelets and inhibiting the aggregation of
blood platelets. Another aspect of the present
invention is to provide novel fibrinogen receptor
antagonist compounds. Other objects of the present
invention are to provide methods of inhibiting the
binding of fibrinogen to blood platelets and
inhibiting the aggregation of blood platelets,
through the administration of novel fibrinogen
receptor antagonist compounds. The above and other
objects are accomplished by the present invention in
the manner described below.

SUMMARY OF THE INVENTION

The present invention provides fibrinogen
receptor antagonist compounds of the formula:

I

- 5 -

for use in inhibiting the binding of fibrinogen to blood platelets and for inhibiting the aggregation of blood platelets. The above-mentioned compounds can be used in a method of acting upon a fibrinogen receptor which comprises administering a therapeutically effective but non-toxic amount of such compound to a mammal, preferably a human. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and, dispersed therein, an effective but non-toxic amount of such compound is another feature of this invention.

DETAILED DESCRIPTION OF THE INVENTION

Fibrinogen receptor antagonist compounds of Formula I are useful in a method of inhibiting the binding of fibrinogen to blood platelets and for inhibiting the aggregation of blood platelets. Fibrinogen receptor antagonists of this invention are illustrated by compounds having the formula:

or the pharmaceutically acceptable salts thereof, or optical isomers thereof.

This invention includes the following abbreviation designations; Bn, benzyl; NMM, N-methylmorpholine; HOBT, 1-hydroxybenzotriazole; EDC, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide-hydrochloride; DMF, dimethylformamide; BOC, tert-butyloxycarbonyl; pTSA, para-toluenesulfonic acid; DMS, dimethylsulfide; TFA, trifluoroacetic acid; THF, tetrahydrofuran; TBDMS, tert-butyldimethylsilyl.

The pharmaceutically acceptable salts of the compounds of Formula I include the conventional non-toxic salts or the quarternary ammonium salts of the compounds of Formula I formed, e.g., from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric,

- 15 -

hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the compounds of Formula I which contain a basic or acidic moiety by conventional chemical methods. Generally, the salts are prepared by reacting the free base or acid with stoichiometric amounts or with an excess of the desired salt-forming inorganic or organic acid or base in a suitable solvent or various combinations of solvents.

The pharmaceutically acceptable salts of the acids of Formula I are also readily prepared by conventional procedures such as treating an acid of Formula I with an appropriate amount of a base, such as an alkali or alkaline earth metal hydroxide e.g. sodium, potassium, lithium, calcium, or magnesium, or an organic base such as an amine, e.g., dibenzyl-ethylenediamine, trimethylamine, piperidine, pyrrolidine, benzylamine and the like, or a quaternary ammonium hydroxide such as tetramethylammonium hydroxide and the like.

The compounds of Formula I are useful in inhibiting the binding of fibrinogen to blood platelets, inhibiting aggregation of blood

- 16 -

platelets, treatment of thrombus formation or embolus formation, in the prevention of thrombus formation or embolus formation, and in the mediation of cell-cell fusion events, such as sperm-egg fusion, resulting in mammalian fertilization inhibition. These compounds are useful as pharmaceutical agents for mammals, especially for humans. The compounds of this invention may be administered to patients where prevention of thrombosis by inhibiting binding of fibrinogen to the platelet membrane glycoprotein complex IIb/IIIa receptor is desired. Compounds of this invention may also be used to prevent or modulate the progress of myocardial infarction, unstable angina and thrombotic stroke, in either acute or chronic settings. In addition, they may be useful in surgery on peripheral arteries (arterial grafts, carotid endarterectomy) and in cardiovascular surgery where manipulation of arteries and organs, and/or the interaction of platelets with artificial surfaces, leads to platelet aggregation and consumption. The aggregated platelets may form thrombi and thromboemboli. Compounds of this invention may be administered to surgical patients to prevent the formation of thrombi and thromboemboli.

Extracorporeal circulation is routinely used for cardiovascular surgery in order to oxygenate blood. Platelets adhere to surfaces of the extracorporeal circuit. Adhesion is dependent on the interaction between GPIIb/IIIa on the platelet membranes and fibrinogen adsorbed to the surface of the circuit. (Gluszko et al., Amer. J. Physiol., 1987, 252:H, pp 615-621). Platelets released from artificial surfaces show impaired

- 17 -

hemostatic function. Compounds of this invention may be administered to prevent adhesion.

Other applications of these compounds include prevention of platelet thrombosis, thromboembolism, reocclusion, and restenosis during and after thrombolytic therapy and prevention of platelet thrombosis, thromboembolism, reocclusion and restenosis after angioplasty of coronary and other arteries and after coronary artery bypass procedures.

The compounds of Formula I may be administered to mammals, preferably in combination with pharmaceutically-acceptable carriers or diluents, optionally with known adjuvants such as alum, in a pharmaceutical composition which is non-toxic and in a therapeutically effective amount, according to standard pharmaceutical practice. The compounds can be administered orally or parenterally, including intravenous, intramuscular, intraperitoneal, trans-dermal, subcutaneous and topical administration.

For oral use of a fibrinogen receptor antagonist according to this invention, the selected compounds may be administered, for example, in the form of tablets or capsules, or as an aqueous solution or suspension. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch, and lubricating agents, such as magnesium stearate, are commonly added. For oral administration in capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active

- 18 -

ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring agents may be added.

5 For intramuscular, intraperitoneal, subcutaneous and intravenous use, sterile solutions of the active ingredient are usually prepared, and the pH of the solutions should be suitably adjusted and buffered. For intravenous use, the total concentration of solutes should be controlled in
10 order to render the preparation isotonic.

The present invention also encompasses a pharmaceutical composition useful in the treatment and prevention of diseases related to platelet aggregation, fibrin formation, and thrombus and
15 embolus formation, comprising the administration of a therapeutically effective but non-toxic amount of the compounds of Formula I, with or without pharmaceutically acceptable carriers or diluents.

Compositions of this invention include
20 fibrinogen receptor antagonist compounds of this invention in combination with pharmacologically acceptable carriers, e.g. saline, at a pH level e.g. 7.4, suitable for achieving inhibition of platelet aggregation. The compositions may also be combined
25 with anticoagulants such as heparin or warfarin. The compositions may also be combined with thrombolytic agents such as plasminogen activators or streptokinase in order to inhibit platelet aggregation in more acute settings. The composition
30 may further be combined with antiplatelet agents such as aspirin. The compositions are soluble in an aqueous medium, and may therefore be effectively administered in solution.

- 19 -

When a compound according to Formula I is used as a fibrinogen receptor antagonist in a human subject, the daily dosage will normally be determined by the prescribing physician with the dosage generally varying according to the age, weight, and response of the individual patient, as well as the severity of the patients symptoms.

In one exemplary application, a suitable amount of compound is administered orally to a heart attack victim before or subsequent to angioplasty. Administration occurs before or subsequent to angioplasty, and is in an amount sufficient to inhibit platelet aggregation, e.g. an amount which achieves a steady state plasma concentration of between about 0.01-100 μM preferably between about 0.01-10 μM .

The present invention also includes a pharmaceutical composition comprising compounds of the present invention in combination with tissue type plasminogen activator or streptokinase. The invention also includes a method for promoting thrombolysis and preventing reocclusion in a patient which comprises administering to the patient an effective amount of compositions of the invention.

The present invention provides a method of inhibiting the binding of fibrinogen to blood platelets, inhibiting aggregation of blood platelets, treating thrombus formation or embolus formation, and in preventing thrombus formation or embolus formation in a mammal, comprising the administration of a therapeutically effective but non-toxic amount of the compounds of this invention, with or without pharmaceutically acceptable carriers or diluents.

- 20 -

The present invention still further provides a method of inhibiting the binding of fibrinogen to blood platelets, inhibiting aggregation of blood platelets, treating thrombus formation or embolus formation, and in preventing
5 thrombus formation or embolus formation in a mammal, comprising the administration of a therapeutically effective but non-toxic amounts of the compounds of this invention in combination with thrombolytic
10 agents, such as tissue plasminogen activators or streptokinase, anticoagulants such as heparin or warfarin, or antiplatelet agents such as aspirin, with or without pharmaceutically acceptable carriers or diluents.

Compounds of the invention can be prepared according to one of the following general procedures:

SCHEME 1

5 An aryl or alkyl alcohol is protected if needed and is oxidized to the corresponding aldehyde via oxalyl chloride/DMSO, pyridinium chlorochromate or similar reagent. Typically, these oxidations are carried out in halocarbon solvents such as CH_2Cl_2 at
10 -78° to room temperature for 0.5-6 hrs. Olefination of the resulting aldehyde with a carboalkoxymethylene phosphorane proceeds to give the desired unsaturated ester. Typically, this reaction is run in halocarbon solvents such as CH_2Cl_2 at $0-60^\circ$ for 1-18 hours.
15 Treatment of this ester with a chiral amine such as R-(+)- α -methylbenzylamine provides a diastereomeric mixture of amines that can be separated typically by column chromatography.

20

SCHEME 2

 An aminoalkanol is protected on N with a BOC, or similarly suitable group such as CBZ, FMOC, etc., and converted to the alkyl halide, typically the iodide. Ph_3P and iodine are typically used for
25 this purpose and the reaction is run in aromatic solvents such as benzene or toluene in halocarbons such as CH_2Cl_2 at $0-50^\circ$ for 5 minutes to 10 hrs. Formation of an alkyl azide is effected by treatment with NaN_3 or similar azide transfer agent, and this
30 azide is catalytically reduced to the corresponding amine in alcohol solvents (EtOH , CH_3OH) at room temperature over the course of 0.5-10 hrs.

- 30 -

SCHEME 3

Alkylation of cyclic amide or urea intermediates occurs in the presence of a suitable base, such as $\text{LiN}(\text{TMS})_2$ or simple amines such as $\text{EtN}(\text{i-Pr})_2$ and an appropriate alkylating agent such as an alkyl iodide or a bromide such as ethyl bromoacetate. Disubstitution in the intermediate is effected by repetition of the deprotonation/alkylation sequence. When an allyl reagent is used to alkylate, subsequent oxidation with $\text{RuCl}_3/\text{NaIO}_4$ or KMnO_4 or other suitable reagent provides the terminal carboxylic acid. This acid may then be coupled via an amide bond with C-terminal chiral or achiral amines to provide further intermediates. Typically, coupling reactions are carried out in DMF or halocarbon solvents such as CH_2Cl_2 utilizing standard reagents such as DCC, EDC, i-butyl chloroformate and the like. Final de-protection of intermediates typically involves base catalyzed hydrolysis of esters and acid catalyzed N-deprotection.

The compounds of Formula I are prepared according to the reaction schemes set forth below. Compound 1, 3-indolepropanol, is commercially available from Aldrich Chemical.

Preparation of 3-(Indol-3-yl)propanol-tert-butyl-
dimethylsilyl ether (2)

To a stirring solution of 3-indolepropanol 1
(15 g, 86 mmol), DMF (200 mL), and imidazole (12.8 g,
5 0.19 mol) at 0°C was added tert-butyldimethylsilyl
chloride (14.2 g, 95 mmol) followed by removal of the
cooling bath. After 20 hours the reaction mixture
was diluted with ether and then washed with H₂O (2
times) and brine, dried (MgSO₄), and concentrated to
10 yield the silyl ether 2 (29 g) as an amber oil.
TLC Rf= 0.54 (20% ethyl acetate/hexanes);
¹H NMR (CDCl₃) δ 8.07 (bs, 1H), 7.77 (d, J=7Hz, 1H),

Preparation of N-Acetyl-3-(indol-3-yl)propanol-tert-
butyldimethylsilyl ether (3)

20 A solution of the indole 2 (29 g, 86 mmol),
CH₂Cl₂ (450 mL), 1,8-diazobicyclo[5.4.0]undec-7-
ene (38 mL, 0.26 mol), 4-dimethylaminopyridine (1.0
g, 8.5 mmol), and acetic anhydride (32 mL, 0.34 mol)
25 was stirred for 1 week at ambient temperature. The
reaction mixture was concentrated and then diluted
with ether. The ether was then washed with H₂O, 5%
KHSO₄ and brine, dried (MgSO₄), and concentrated.
Flash chromatography (silica, 5% ethyl
acetate/hexanes) gave the acylated product 3 (27 g)
30 as a yellow oil.
TLC Rf= 0.56 (20% ethyl acetate/hexanes).

- 64 -

Preparation of N-Acetyl-3-(indol-3-yl)propanol (4)

To a stirred solution of the silyl ether 3 (27 g, 81 mmol) in THF (270 mL) at ambient temperature was added a premixed solution of n-Bu₄NF (1M in THF: 244 mL, 0.24 mol) and AcOH (14 mL, 0.24 mmol) (1:1). After 20 hours the reaction mixture was diluted with ether and then washed with H₂O (2 times) and brine, dried (MgSO₄), and concentrated to give the alcohol 4 (19 g) as a yellow crystalline solid.

TLC R_f = 0.35 (60% ethyl acetate/hexanes);

Preparation of 5-(N-Acetyl-indol-3-yl)pent-2-enoic acid ethyl ester (5)

To a stirring solution of oxalyl chloride (11.4 mL, 0.13 mol) in CH₂Cl₂ (440 mL) at -78°C was added dry DMSO (12.4 mL, 0.17 mol) dropwise. After 5 minutes, gas evolution ceased and the alcohol 4 (19 g, 87 mmol) in CH₂Cl₂ (40 mL) was added. After 30 minutes, NEt₃ (73 mL, 0.52 mol) was added to effect a thick slurry. The cooling bath was removed and the reaction stirred for an additional 15 minutes before adding (carbethoxymethylene)triphenyl phosphorane (33.5 g, 96 mmol). After 2.0 hours, the reaction mixture was diluted with ether and then washed with H₂O (2 times), 5% KHSO₄ and brine, dried (MgSO₄), and concentrated. Flash chromatography (20% ethyl acetate/hexanes) gave the olefin 5 (14 g) as a white solid.

3-yl)ethyl] β -alanine ethyl ester (6a) and N-(R)- α -
Methylbenzyl-3(S)-[2-(indol-3-yl)ethyl] β -alanine
ethyl ester (6b)

A mixture of olefin 5 (2.77 g, 9.7 mmol) and
R-(+)- α -methylbenzylamine (5.03 mL, 39 mmol) was
heated under a cold finger at 110°C for 40 hours.

The cooled reaction mixture was applied directly to a
flash chromatography column (silica, 40:2:1,
hexanes:ethyl acetate: 2-propanol). The (R,R) isomer
6a eluted first (1.19 g) as a viscous yellow oil
which solidified on standing. Recrystallization from
hexanes/ethyl acetate provided crystalline material.
The (R,S) isomer 6b eluted next (1.55 g) as a viscous
yellow oil containing ca 10% of the (R,R) isomer.

Preparation of 3-[2-(N-BOC-piperidin-4-yl)ethylene]-2-
(methoxy)pyridine (104)

To a suspension of 102 (5.0 g, 8.5 mmol) in
dry THF at 0°C was added $\text{NaN}(\text{TMS})_2$ (9.4 mL, 9.4 mmol,
5 1M/hexanes) dropwise. After 15 min. a solution of 103
(0.97 g, 7.0 mmol) (Tetrahedron Letters (1988) 29,
773) in THF (3 mL) was added dropwise to the
yellow/orange homogeneous reaction mixture. After 1h
the cooling bath was removed followed by continued
10 stirring for 30 min. The reaction was quenched with
 H_2O and ether. The aqueous phase was reextracted with
ether, the organic layers combined and then washed
with brine, dried (Na_2SO_4) and concentrated. Flash
chromatography (silica, 15% ethyl acetate/hexanes)
15 gave 104 as a colorless oil.

Preparation of 3-[2-(N-BOC-piperidin-4-yl)ethyl]-2-
methoxypyridine (105)

25 A mixture of 104 (1.4 g, 4.3 mmol), ethyl
acetate (22 mL) and 10% Pd/C (0.27 g, 20%/wt) was
stirred under a hydrogen atmosphere (1 atm) at ambient
temperature for 4 h. The reaction mixture was
30 filtered through a celite pad and the filtrate
concentrated to give 105 as a cloudy colorless oil.

Preparation of 3-[2-(N-BOC-piperidin-4-yl)ethyl]-2-pyridon-1-yl (106)

To a solution of 105 (0.81 g, 2.5 mmol) in dry CH₃CN (13 mL) was added NaI (0.94 g, 6.3 mmol) followed by chlorotrimethylsilane (0.80 mL, 6.3 mmol). The resulting opaque yellow solution was heated at 60°C for 2.0 h. The cooled reaction mixture was quenched with methanol (50 mL), stirred for 10 min. and then concentrated. The residue was dissolved in dioxane/H₂O (6.7 mL/3.3 mL) then treated with 1N NaOH (5.0 mL, 5.0 mmol). The solution was cooled to 0°C and then treated with BOC₂O (1.1 g, 5.0 mmol) followed by removal of the cooling bath. After stirring overnight the dioxane was evaporated and the residue diluted with H₂O (10 mL) and ethyl acetate (50 mL), followed by acidification to pH ~ 1.0 with 20% KHSO₄. The organic phase was separated and then washed with H₂O and brine, dried (MgSO₄) and concentrated. Flash chromatography (silica, 2:1 CH₂Cl₂/acetone) gave 106 as a pale yellow solid.

TLC Rf = 0.19 (2:1 CH₂Cl₂/acetone); ^1H NMR (CDCl₃, 400 MHz) δ 7.30 (m, 3H), 6.23 (t, J=7 Hz, 1H), 4.04 (m, 2H), 2.69 (m, 2H), 2.57 (m, 2H), 1.74 (m, 2H), 1.56 (m, 2H), 1.48 (m, 1H), 1.47 (s, 9H), 1.16 (m, 2H).

Preparation of Ethyl {3-[2-(N-BOC-piperidin-4-yl)-
ethyl]-2-pyridon-yl}acetate (107)

To a stirred solution of 106 (0.44 g, 1.4 mmol) in dry DMF (7.2 mL) at 0°C was added NaN(TMS)₂ (2.1 mL, 2.1 mmol, 1M/hexanes) dropwise. After 30 min. ethyl bromoacetate (0.79 mL, 7.2 mmol) was added dropwise to the reaction mixture. After an additional hour the reaction was diluted with ethyl acetate and then washed with H₂O, 5% KHSO₄, sat. NaHCO₃ and brine, dried (MgSO₄) and concentrated. Flash chromatography (silica, 45% ethyl acetate/hexanes) gave 107 as a colorless oil.

TLC Rf = 0.33 (60% ethyl acetate/hexanes); 7.20 (dd, J=6 and 1 Hz, 1H), 7.11 (dd, J=7 and 2 Hz, 1H), 6.15 (t, J=7 Hz, 1H), 4.62 (s, 2H), 4.24 (q, J=7 Hz, 2H), 4.04 (m, 2H), 2.69 (m, 2H), 2.55 (m, 2H), 1.72 (m, 2H), 1.52 (m, 2H), 1.78 (m, 1H), 1.48 (s, 9H), 1.13 (m, 2H).

Preparation of {3-[2-(N-BOC-piperidin-4-yl)ethyl]-2-pyridon-1-yl} acetic acid (108)

Utilizing the procedure for converting 55 to 56, 107 (0.51 g, 1.3 mmol) gave 108 as a colorless foam.

Applicants hereby incorporate by reference
procedures for preparing compounds of the present
invention whereby guanidines are prepared from amines
and whereby amidines are prepared from corresponding
nitriles. Guanidines may be prepared from amines by
10 those having ordinary skill in the art upon reaction
with 3,5-dimethylpyrazole-1-carboxamidine nitrate
(Methods Enzymol., 25b, 558, 1972). Amidines may be
prepared from the corresponding nitrile by those
15 having ordinary skill in the art using procedures
demonstrated by Boere, R.T., et. al. J. Organomet.
Chem., 331(2), 161-7, 1987; and Fuks, R., Tetrahedron,

In vivo Activity

The following protocols were used to determine in vivo activity in dogs of fibrinogen receptor antagonists of the present invention.

5 A mongrel dog of either sex (weighing 7.5 to 11.5 kg) is comfortably positioned in a nylon sling which exposes the legs and keeps the dog stationary. Five ml of blood is withdrawn from either saphenous or cephalic veins with a plastic syringe containing 10 0.5 ml of 3.8% citrate via a 19-gauge butterfly. An additional 1 ml of citrated blood is taken to measure whole blood platelet counts. Ex vivo platelet aggregations are done with the agonists ADP (10 μ M) and collagen (10 μ g/ml) both primed with 1 μ M 15 epinephrine. Platelet-rich plasma (PRP) is obtained by centrifuging the blood at 150 x g for 5 minutes. Platelet counts are adjusted to 200,000/mm³ with platelet-poor plasma.

20 Oral administration of a drug is done either as a gelatin capsule or a gastric lavage. For the gastric lavage method, 5 ml of the drug solution is administered to the dog through a feeding tube. Blood samples for ex vivo platelet aggregation are 25 taken at the following time points: 0, 20, 40, 70, 90, 150, 200, 250, 300, 350, 480 min. 24 hr. 30 hr, and 48 hr. At each time point, the remaining platelet-poor plasma is saved and frozen for drug levels. Three additional blood samples are taken at 30 30, 55, and 110 minutes after dosing for drug plasma levels.

- 125 -

For the intravenous infusion, blood samples for ex vivo platelet aggregation are taken at the following time points: 0, 30, 45, 60, 90 and 120 min into the infusion and 2, 5, 15, 30, 60, 90, 120, 180, 240, 300, 360, and 420 minutes after the infusion stops. At each time point, the remaining platelet-poor plasma is saved and frozen for drug levels. The drug is infused for 120 minutes at a constant rate of 0.1 ml/min.

For the intravenous bolus, 5 ml of the drug solution is administered quickly. Blood samples for ex vivo platelet aggregation are taken at 0, 1, 5, 10, 15, 30, 45, 60, 90, 120, 180, and 240 minutes after the bolus. At all time points, the remaining platelet-poor plasma was saved and frozen for drug levels.

In the oral and intravenous groups, blood collection times are recorded at each time point in order to determine drug plasma levels.

The following compound

was evaluated according to the procedures described above.

- 126 -

Inhibition of platelet aggregation (% of control) induced by intravenous infusion at rates of 10 µg/kg/min and 25 µg/kg/min was measured. Inhibition was nearly complete during infusion and partial inhibition existed for several hours after infusion cessation.

5

Inhibition of platelet aggregation (% of control) induced by single oral administration of 2 mg/kg was also measured. % Inhibition of platelet aggregation was greater than 50% for a period of eight hours.

13. A composition for inhibiting the aggregation of blood platelets in a mammal, comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

30

14. A composition for inhibiting the aggregation of blood platelets in a mammal, comprising a compound of Claim 1 in combination with a thrombolytic agent and a pharmaceutically acceptable carrier.

- 147 -

15. The composition of Claim 14, wherein the thrombolytic agent is a plasminogen activator or streptokinase.

5 16. A composition for inhibiting the aggregation of blood platelets in a mammal, comprising a compound of Claim 1 in combination with an anticoagulant and pharmaceutically acceptable carrier.

10 17. The composition of Claim 16, wherein the anticoagulant is heparin or warfarin.

15 18. A composition for preventing thrombus or embolus formation in a mammal, comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

20 19. A composition for preventing thrombus or embolus formation in a mammal, comprising a compound of Claim 1 in combination with a thrombolytic agent and a pharmaceutically acceptable carrier.

25 20. The composition of Claim 18, wherein the thrombolytic agent is plasminogen activator or streptokinase.

30 21. A composition for preventing thrombus or embolus formation in a mammal, comprising a compound of Claim 1 in combination with an anticoagulant and pharmaceutically acceptable carrier.

- 148 -

22. The composition of Claim 21, wherein the anticoagulant is heparin or warfarin.

5 23. A composition for treating thrombus or embolus formation in a mammal, comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

10 24. A composition for treating thrombus or embolus formation in a mammal, comprising a compound of Claim 1 in combination with a thrombolytic agent and a pharmaceutically acceptable carrier.

15 25. The composition of Claim 24, wherein the thrombolytic agent is plasminogen activator or streptokinase.

20 26. A composition for treating thrombus or embolus formation in a mammal, comprising a compound of Claim 1 in combination with an anticoagulant and pharmaceutically acceptable carrier.

27. The composition of Claim 26, wherein the anticoagulant is heparin or warfarin.

25 28. A composition for treating thrombus or embolus formation in a mammal, comprising a compound of Claim 1 in combination with an antiplatelet agent and a pharmaceutically acceptable carrier.

30

- 149 -

29. The composition of Claim 28, wherein the antiplatelet agent is aspirin.

5 30. A method for inhibiting the binding of fibrinogen to blood platelets in a mammal, comprising administering to the mammal a composition of Claim 13.

10 31. A method for inhibiting the aggregation of blood platelets in a mammal, comprising administering to the mammal the composition of Claim 13.

15 32. A method for inhibiting the aggregation of blood platelets in a mammal, comprising administering to the mammal the composition of Claim 14.

20 33. A method for inhibiting the aggregation of blood platelets in a mammal, comprising administering to the mammal the composition of Claim 16.

25 34. A method for preventing thrombus or embolus formation in a mammal, comprising administering to the mammal the composition of Claim 18.

- 156 -

73. A composition for inhibiting the aggregation of blood platelets in a mammal, comprising the compound of Claim 9 and a pharmaceutically acceptable carrier.

5 74. A method for inhibiting the aggregation of blood platelets in a mammal, comprising administering to the mammal the composition of claim 73.

10 75. A composition for preventing thrombus or embolus formation in a mammal, comprising the compound of Claim 9 and a pharmaceutically acceptable carrier.

15 76. A method for preventing thrombus or embolus formation in a mammal, comprising administering to the mammal the composition of Claim 75.

20 77. A composition for inhibiting the binding of fibrinogen to blood platelets in a mammal comprising the compound of Claim 10 and a pharmaceutically acceptable carrier.

25 78. A method for inhibiting the binding of fibrinogen to blood platelets in a mammal, comprising administering to the mammal a composition of Claim 77.

30

- 157 -

79. A composition for inhibiting the aggregation of blood platelets in a mammal, comprising the compound of Claim 10 and a pharmaceutically acceptable carrier.

5

80. A method for inhibiting the aggregation of blood platelets in a mammal, comprising administering to the mammal the composition of Claim 79.

10

81. A composition for preventing thrombus or embolus formation in a mammal, comprising the compound of Claim 10 and a pharmaceutically acceptable carrier.

15

82. A method for preventing thrombus or embolus formation in a mammal, comprising administering to the mammal the composition of Claim 81.

20

83. A composition for inhibiting the binding of fibrinogen to blood platelets in a mammal comprising the compounds of Claim 11 and a pharmaceutically acceptable carrier.
